

Apex Intelligence Immortal Machine

Production Equilibrium Achieved

The Six Guardians

1. Schema Migration Requirement

Do not add columns in code without updating schema.ts and creating a migration. Every column must have a schema entry and migration.

3. CI Pipeline Integrity

Ensure new features pass the full CI pipeline before requesting review. All steps must pass: lint !' verify-barrels !' verify-schema-sync !' verify-drizzle-syntax !' test !' build.

5. Barrel-Only Imports

Maintain barrel-only imports. All src/lib imports must use barrel exports via @/lib/*. No deep imports.

2. Verification Scripts

Do not bypass verify-barrels or verify-schema-sync.ts. These verification scripts are mandatory and must pass before any code is merged.

4. LangChain Safety

Preserve LangChain safety. Only use supported LangChain packages. No experimental imports allowed.

6. Sentry Release Integrity

Maintain Sentry release integrity. All production deployments must create a Sentry release via scripts/create-sentry-release.ts after each deploy.
